The SAP does not specify correlates analyses in baseline positive vaccine recipients. This table summarizes descriptively the same information for baseline positive vaccine recipients that was summarized for baseline negative vaccine recipients. Cases for Day 29 markers are baseline positive per-protocol vaccine recipients with the symptomatic infection COVID-19 primary endpoint diagnosed starting 7 days after the Day 29 study visit. Cases for Day 57 markers are baseline positive per-protocol vaccine recipients with the symptomatic infection COVID-19 primary endpoint diagnosed starting 7 days after the Day 57 study visit. Non-cases/Controls are baseline positive per-protocol vaccine recipients sampled into the random subcohort with no COVID-19 endpoint diagnosis by the time of data-cut.

N is the number of cases sampled into the subcohort within baseline covariate strata.

The denominator in Resp Rate is the number of participants in the whole per-protocol cohort within baseline covariate strata, calculated using inverse probability weighting.

## Day 57 Univariate CoR: Cox Models of Risk

The main regression model is the Cox proportional hazards model. All plots are made with Cox models fit unless specified otherwise.

### 4.1 Hazard ratios

\*Baseline covariates adjusted for: baseline risk score, meeting the protocol randomization stratification criterion for being at heightened risk of COVID (yes or no), community of color or not. Maximum failure event time 164 days.

\*\*No. at-risk = estimated number in the population for analysis: baseline negative per-protocol vaccine recipients not experiencing the COVID endpoint through 6 days post Day 57 visit; no. cases = number of this cohort with an observed COVID endpoint.

\*\*\*q-value and FWER (family-wide error rate) are computed over the set of p-values both for quantitative markers and categorical markers using the Westfall and Young permutation method (5 replicates).

Cutpoints: Anti Spike IgG (IU/ml) [3.34, 4.01], Anti RBD IgG (IU/ml) [3.48, 4.21], Pseudovirus-nAb cID50 [2.37, 2.86], Pseudovirus-nAb cID80 [2.58, 2.96], all on the log10 scale.

\*\*No. at-risk = estimated number in the population for analysis: baseline negative per-protocol vaccine recipients not experiencing the COVID endpoint through 6 days post Day 57 visit; no. cases = number of this cohort with an observed COVID endpoint.

\*\*\*Generalized Wald-test p-value of the null hypothesis that the hazard rate is constant across the Lower, Middle, and Upper tertile groups.

Table 4.5: Controlled VE as functions of Day 57 markers (=s) among baseline negative vaccine recipients with 95% bootstrap point-wise confidence intervals (5 replicates). Overall cumulative incidence from 7 to 164 days post Day 57 was 0.005 in vaccine recipients compared to 0.090 in placebo recipients, with cumulative vaccine efficacy 94.6% (95% CI 94.1 to 95.6%).

## Day 29 Univariate CoR: Cox Models of Risk

The main regression model is the Cox proportional hazards model. All plots are made with Cox models fit unless specified otherwise.

### 5.1 Hazard ratios

Table 5.1: Inference for Day 29 antibody marker covariate-adjusted correlates of risk of COVID in the vaccine group: Hazard ratios per 10-fold increment in the marker\*

MockCOVE Immunologic Marker	No. cases / No. at-risk**	HR per 10-fold incr. Pt. Est.	P-value 95% CI (2-sided)	q-value ***	FWER

\*Baseline covariates adjusted for: baseline risk score, meeting the protocol randomization stratification criterion for being at heightened risk of COVID (yes or no), community of color or not. Maximum failure event time 192 days.

\*\*No. at-risk = estimated number in the population for analysis: baseline negative per-protocol vaccine recipients not experiencing the COVID endpoint through 6 days post Day 29 visit; no. cases = number of this cohort with an observed COVID endpoint.

\*\*\*q-value and FWER (family-wide error rate) are computed over the set of p-values both for quantitative markers and categorical markers using the Westfall and Young permutation method (5 replicates).

Maximum failure event time 192 days. Cutpoints: Anti Spike IgG (IU/ml) [2.14, 2.65], Anti RBD IgG (IU/ml) [2.37, 2.98], Pseudovirus-nAb cID50 [1.07, 1.45], Pseudovirus-nAb cID80 [1.26, 1.61], all on the log10 scale.

<sup>1</sup>Conservative (upper bound) estimate assuming unmeasured confounding at level  $RR_{UD}(0, 1) = RR_{EU}(0, 1) = 2$  and thus  $B(0, 1) = 4/3$ .

<sup>2</sup>E-values are computed for upper tertile ( $s = 1$ ) vs. lower tertile ( $s = 0$ ) biomarker subgroups after controlling for baseline risk score, meeting the protocol randomization stratification criterion for being at heightened risk of COVID (yes or no), community of color or not; UL = upper limit.

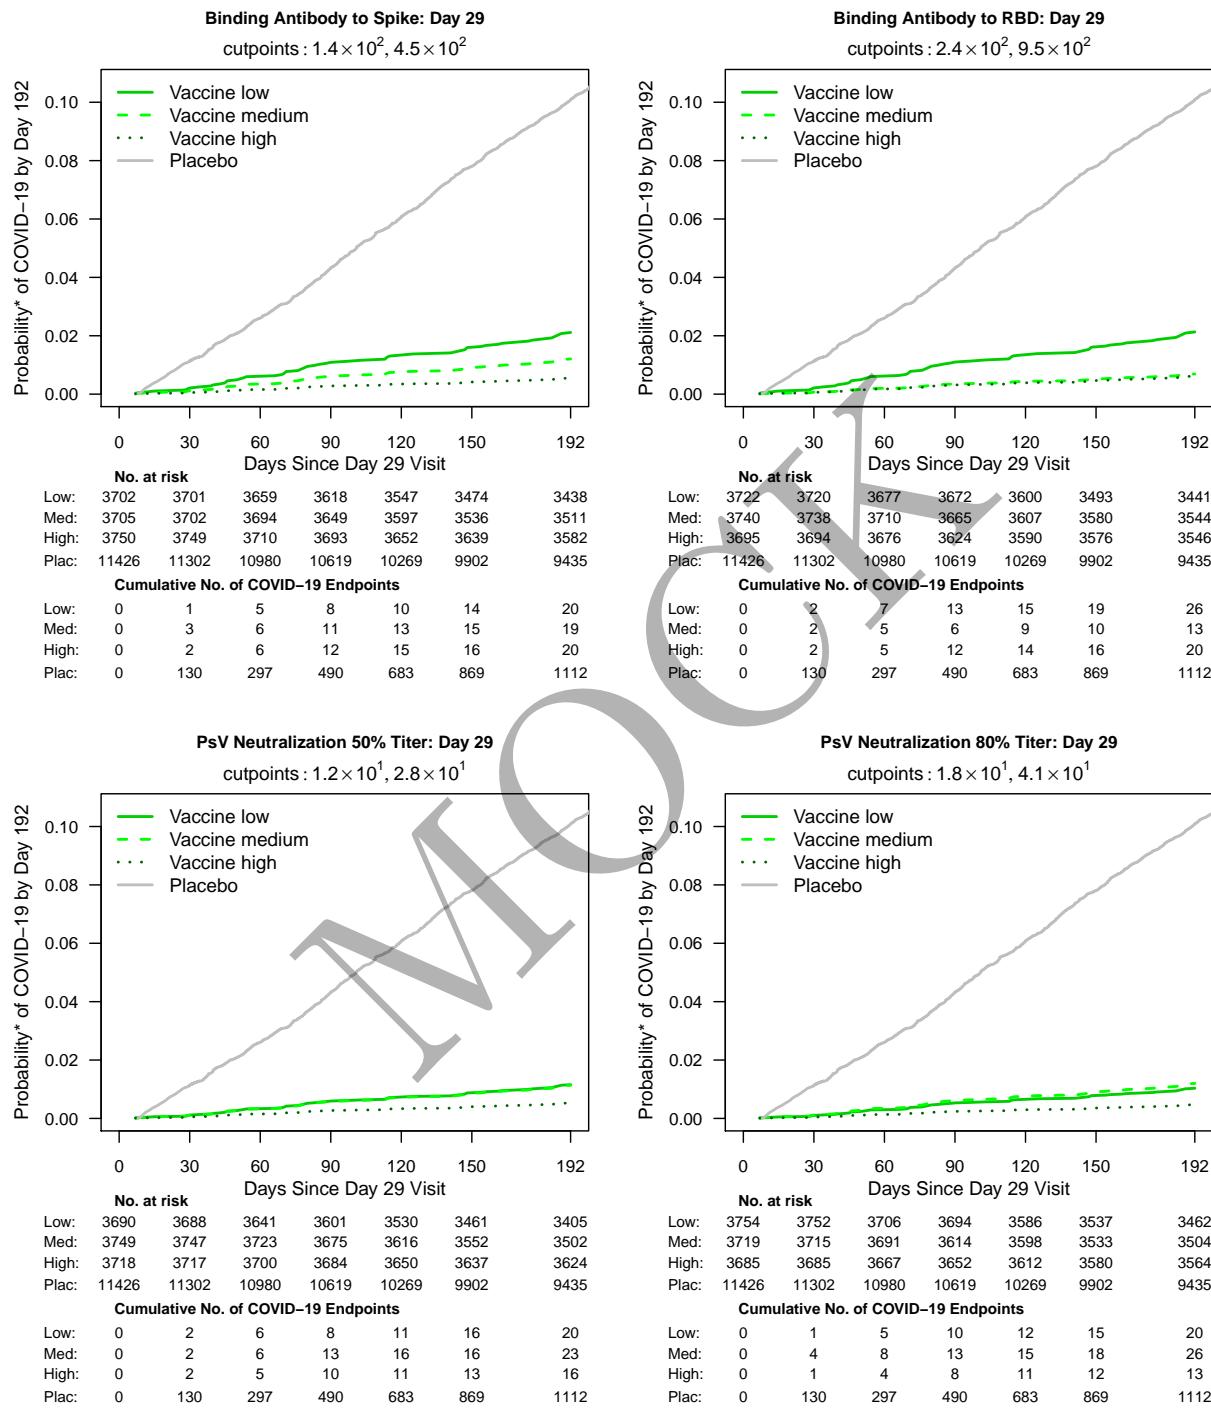

Figure 5.6: Marginalized cumulative incidence rate curves for trichotomized Day 29 markers among baseline negative vaccine recipients. The gray line is the overall cumulative incidence rate curve in the placebo arm.

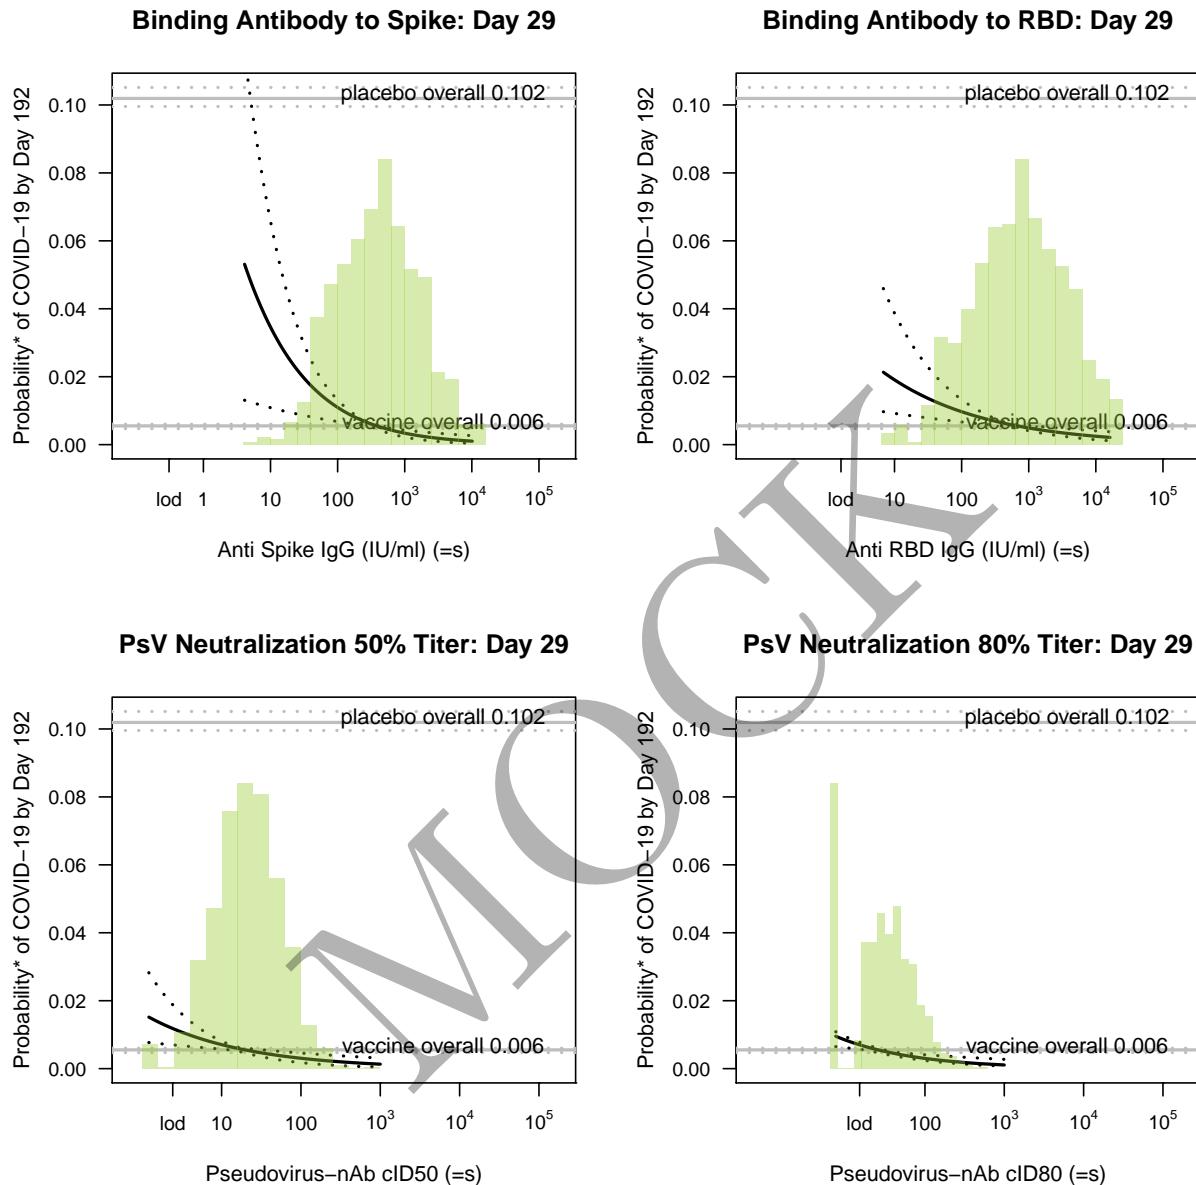

Figure 5.7: Marginalized cumulative risk by Day 192 as functions of Day 29 markers (=s) among baseline negative vaccine recipients with 95% bootstrap point-wise confidence bands (5 replicates). The horizontal lines indicate the overall cumulative risk of the placebo and vaccine arms by Day 192 and its 95% point-wise confidence interval. Histograms of the immunological markers in the vaccine arm are overlaid. lod = 0.3, 1.6, 2.4, 15 for bAb Spike, bAb RBD, PsV nAb ID50, PsV nAb ID80, respectively.

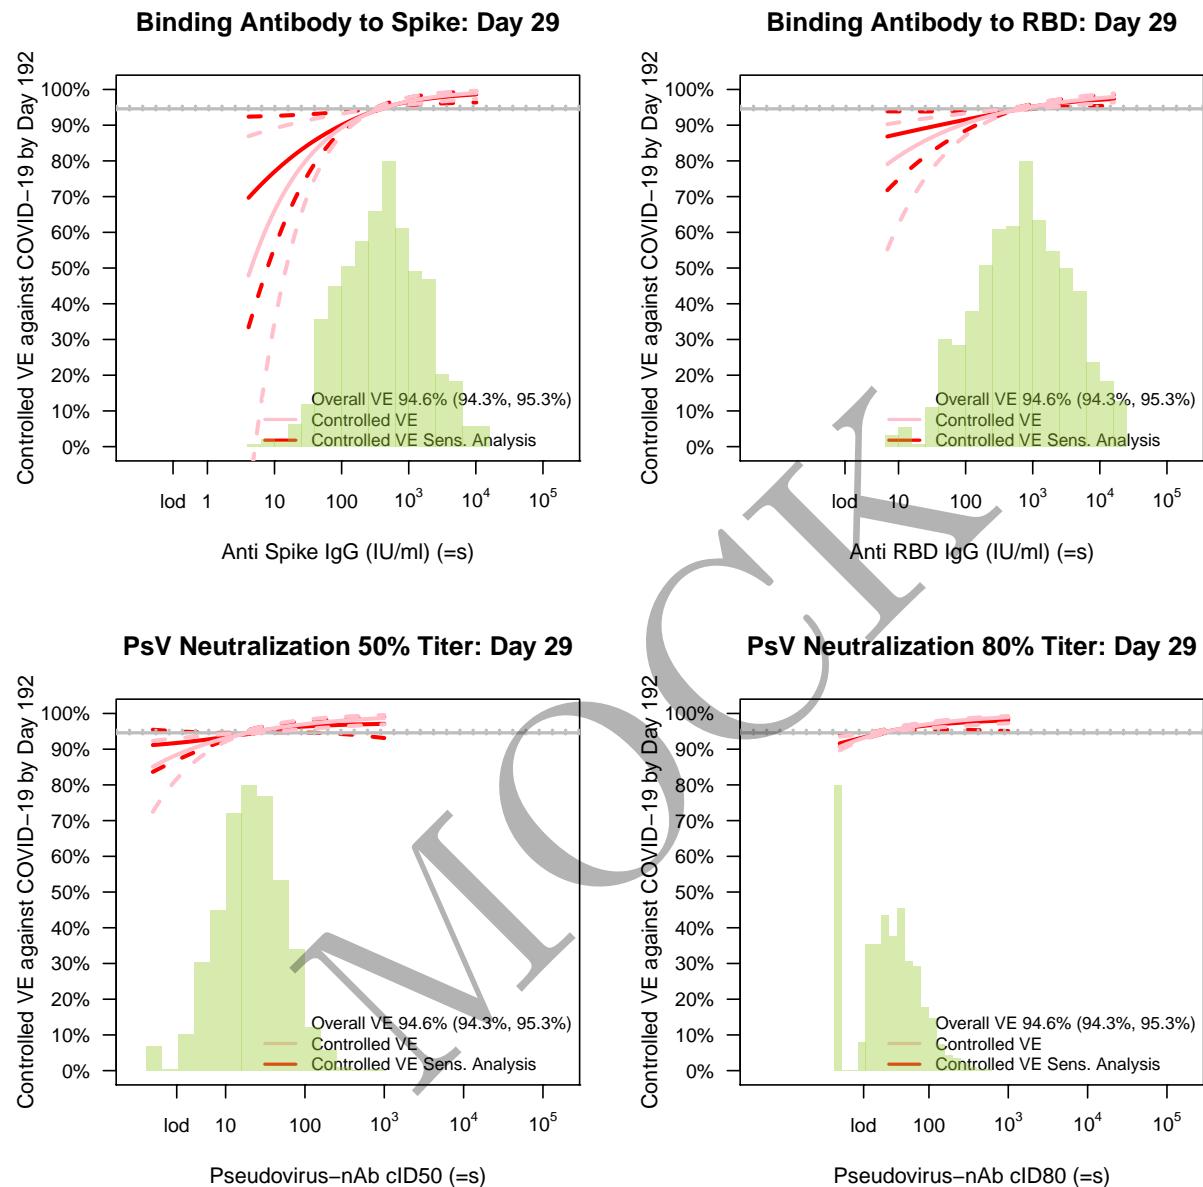

Figure 5.8: Controlled VE with sensitivity analysis as functions of Day 29 markers (=s) among baseline negative vaccine recipients with 95% bootstrap point-wise confidence bands (5 replicates). Histograms of the immunological markers in the vaccine arm are overlaid. lod = 0.3, 1.6, 2.4, 15 for bAb Spike, bAb RBD, PsV nAb ID50, PsV nAb ID80, respectively.

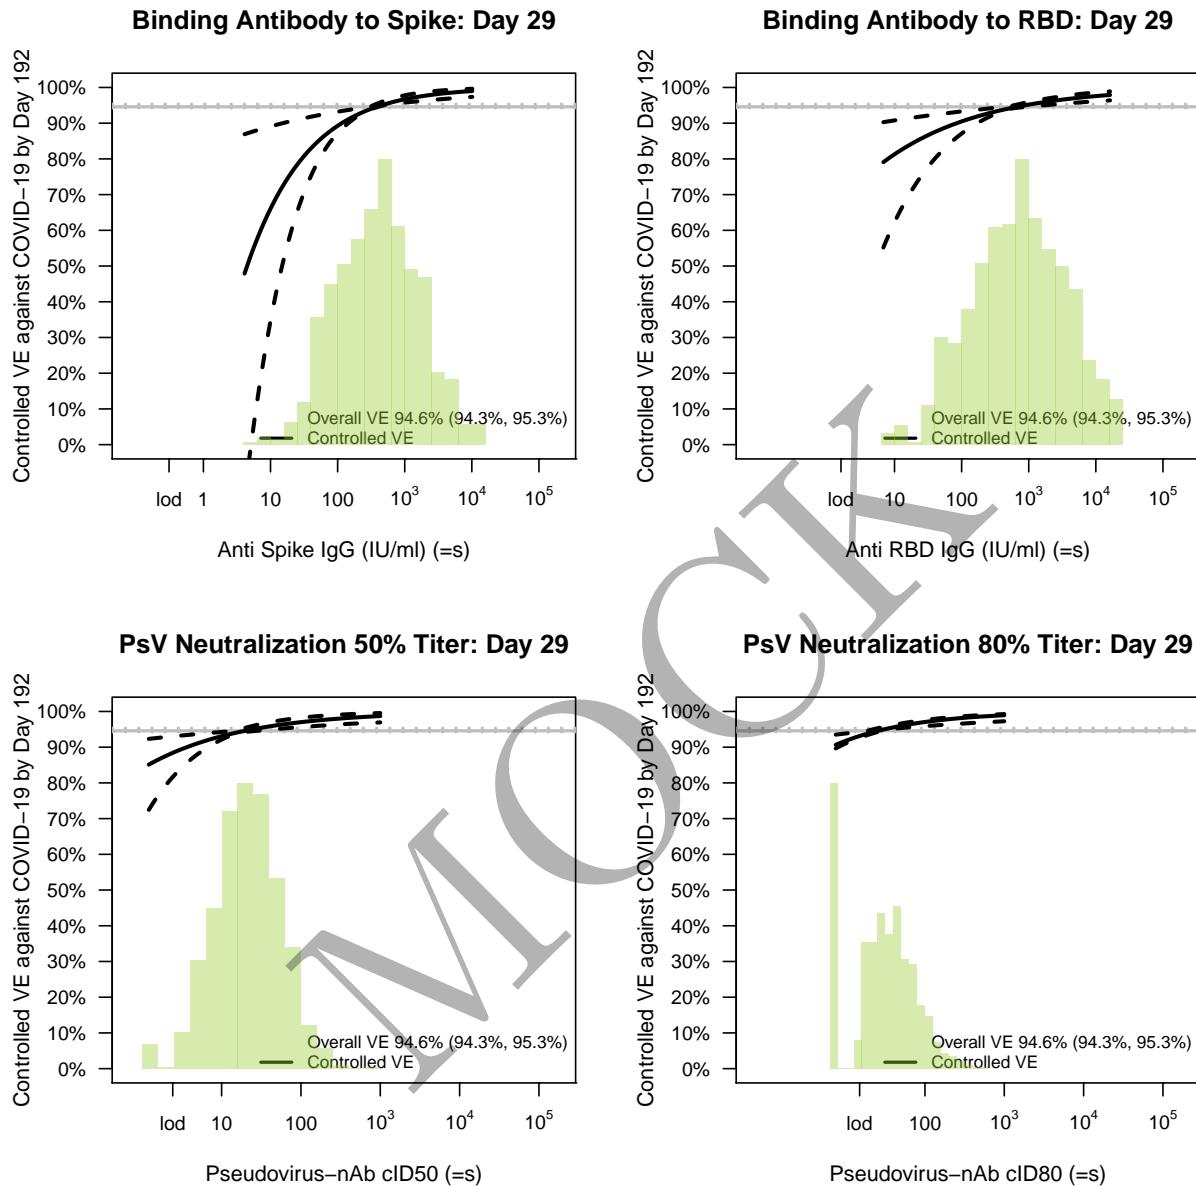

Figure 5.9: Controlled VE with sensitivity analysis as functions of Day 29 markers (=s) among baseline negative vaccine recipients with 95% bootstrap point-wise confidence bands (5 replicates). Histograms of the immunological markers in the vaccine arm are overlaid.  $\text{Iod} = 0.3, 1.6, 2.4, 15$  for bAb Spike, bAb RBD, PsV nAb ID50, PsV nAb ID80, respectively.

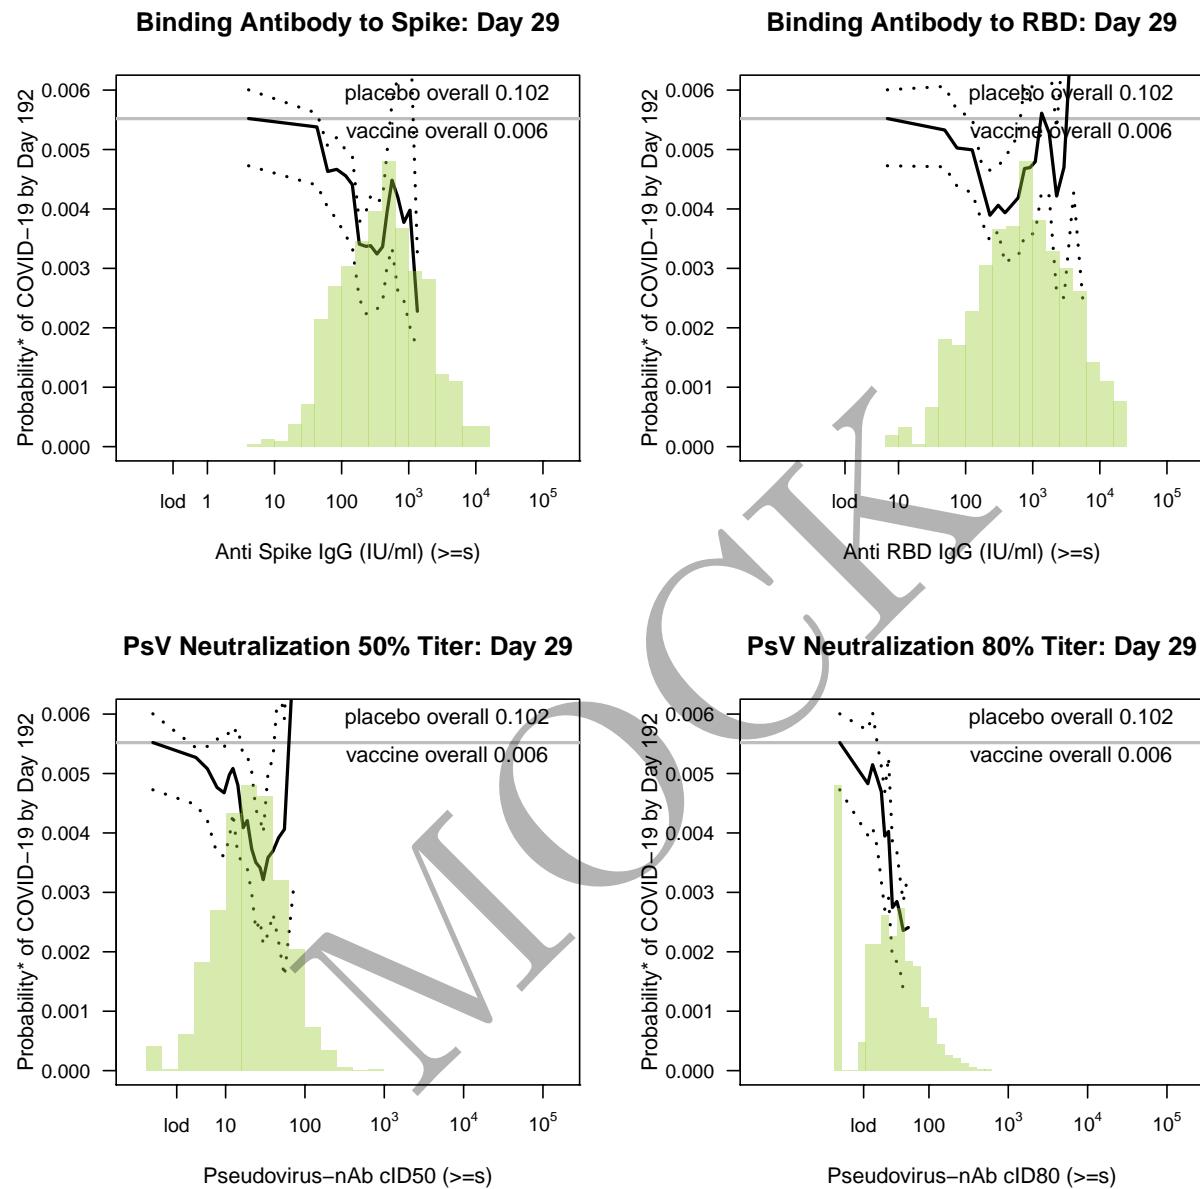

Figure 5.10: Marginalized cumulative risk by Day 192 as functions of Day 29 markers above a threshold ( $\geq s$ ) among baseline negative vaccine recipients with 95% bootstrap point-wise confidence bands (at least 5 cases are required, 5 replicates). The horizontal lines indicate the overall cumulative risk of the vaccine arm by Day 192 and its 95% point-wise confidence interval. Histograms of the immunological markers in the vaccine arm are overlaid.  $l_{od} = 0.3, 1.6, 2.4, 15$  for bAb Spike, bAb RBD, PsV nAb ID50, PsV nAb ID80, respectively.

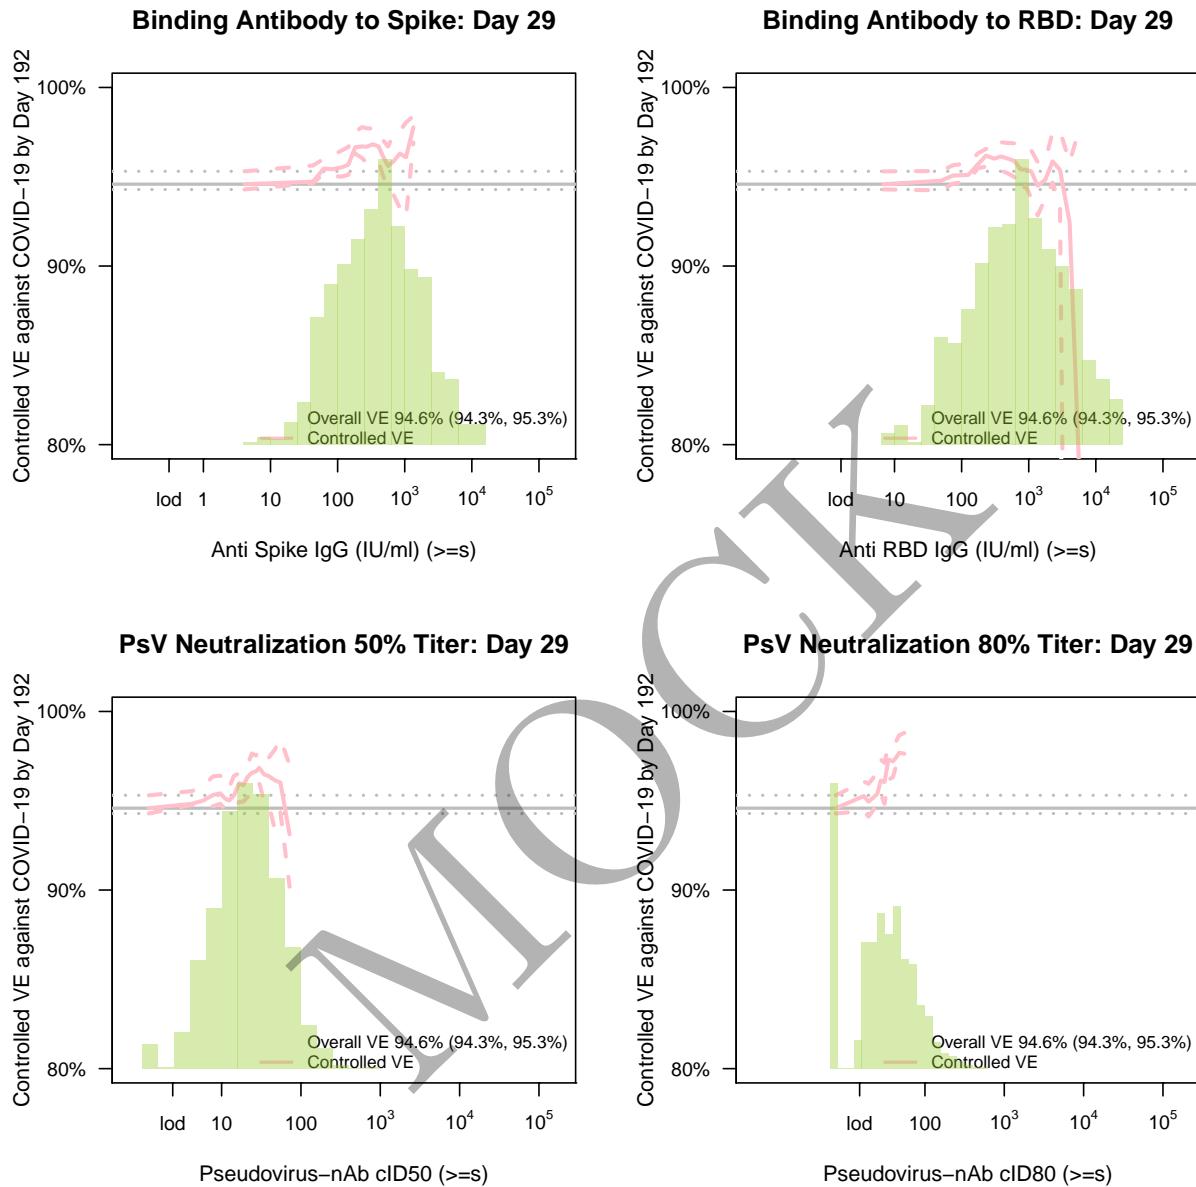

Figure 5.11: Controlled VE as functions of Day 29 markers ( $\geq s$ ) among baseline negative vaccine recipients with 95% bootstrap point-wise confidence bands (5 replicates). Histograms of the immunological markers in the vaccine arm are overlaid.  $l_{od} = 0.3, 1.6, 2.4, 15$  for bAb Spike, bAb RBD, PsV nAb ID50, PsV nAb ID80, respectively.

Table 5.5: Controlled VE as functions of Day 29 markers (=s) among baseline negative vaccine recipients with 95% bootstrap point-wise confidence intervals (5 replicates). Overall cumulative incidence from 7 to 192 days post Day 29 was 0.006 in vaccine recipients compared to 0.102 in placebo recipients, with cumulative vaccine efficacy 94.6% (95% CI 94.3 to 95.3%).

## Chapter 6

# Univariate CoR: Nonparametric Threshold Modeling ( $>= s$ )

An extension of the unadjusted nonparametric threshold-searching approach developed in Donovan, Hudgens, and Gilbert (2019), the covariate-adjusted TMLE-based approach developed by van der Laan, Zhang, Gilbert (submitted) is used to estimate the so-called threshold-response function  $E_X[E[Y | S \geq s, X, A = 1] | A = 1]$  for a range of thresholds  $s$ . Here,  $X$  is a set of baseline characteristics,  $A = 1$  represents the vaccine group,  $S$  is the biomarker/immune-response/correlate of interest, and  $Y$  is the indicator of COVID disease before some time point  $t_f$ . This parameter can be viewed as a causal/covariate-adjusted version of the parameter  $P(Y = 1 | S \geq s, A = 1)$ . Intuitively, the threshold-response at a given threshold is the expected probability of obtaining COVID disease if one experiences a marker/immune-response value above that threshold. The threshold-response function is estimated for each of the four Day 57 antibody markers, in each case adjusting for the baseline covariates: baseline risk score, high risk indicator, and underrepresented minority status. A parametric learner, selected via cross-validation, is used for the covariate adjustment. A number of plots and tables are reported:

1. A plot and table with risk estimates and point-wise 95% confidence intervals
2. A plot and table with risk estimates and simultaneous 95% confidence bands
3. Monotone-corrected versions of 1 and 2.

A reverse cumulative distribution function curve estimated by the IPW NPMLE of the marker values is superimposed on the threshold-response plots and a dashed red line is added to mark the threshold value after which no more events are observed.

## Chapter 8

# Day 57 Univariate CoR: Nonlinear modeling

To explore nonlinear association and threshold modeling, we fit smoothing spline models using the mgcv R package and two-phase models using the chngpt R package.

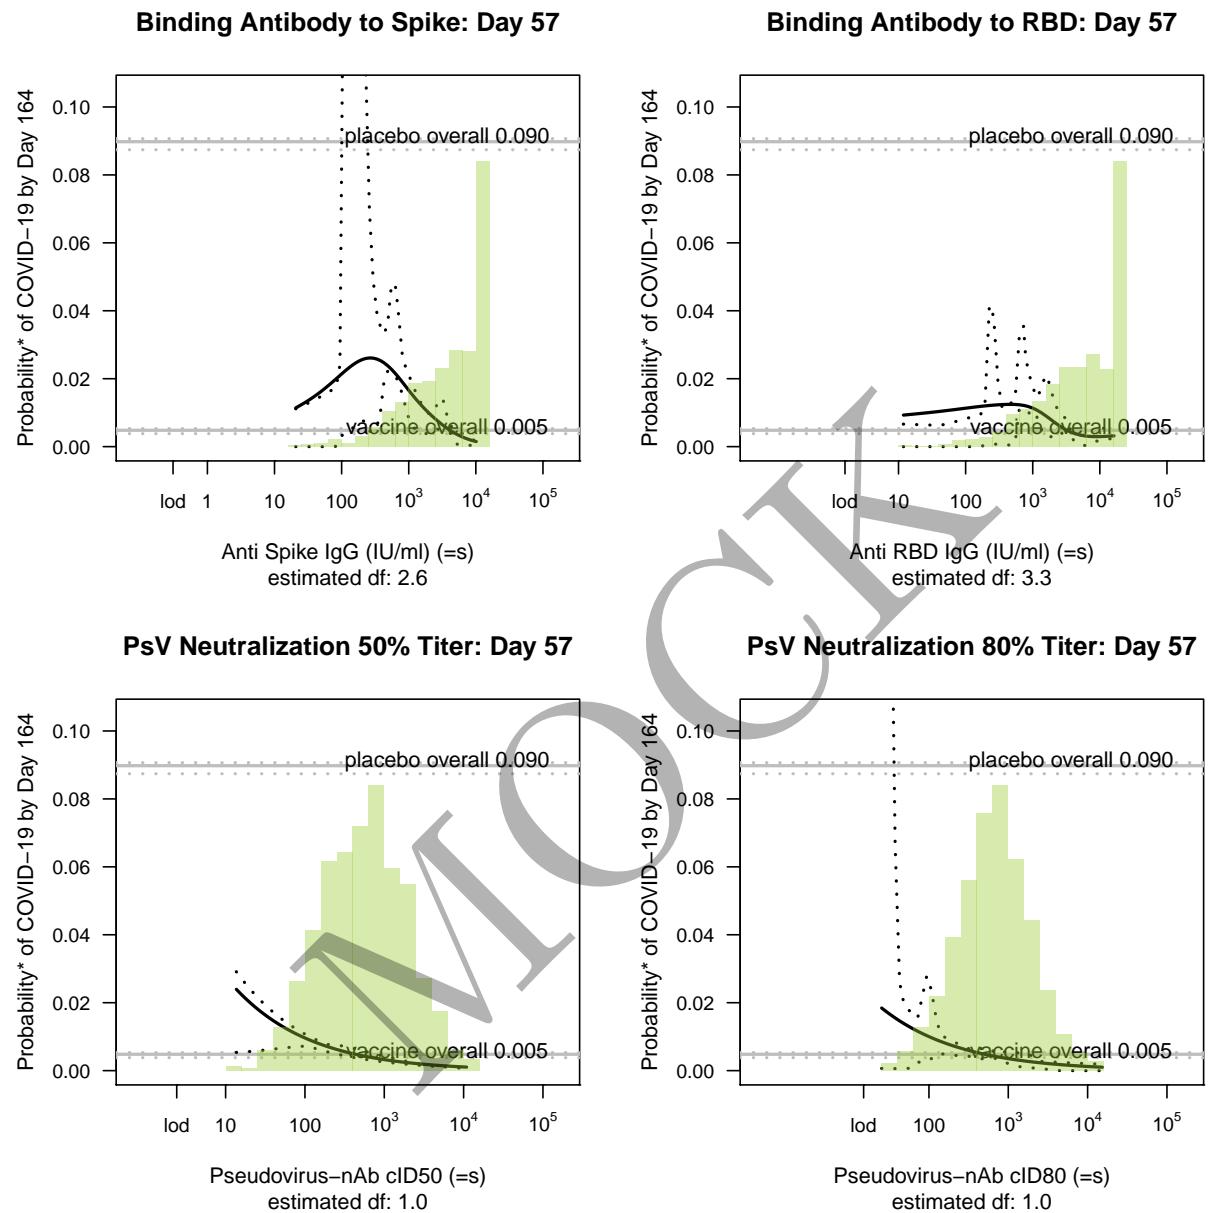

Figure 8.1: Marginalized risk as functions of Day 57 markers (=s) among baseline seronegative vaccine recipients with 95% bootstrap point-wise confidence bands (5 replicates) as modeled by GAM with automatic smoothness estimation. Baseline covariates adjusted for: baseline risk score, meeting the protocol randomization criterion for being at heightened risk of COVID (yes or no), community of color or not. The horizontal lines indicate the overall cumulative risk of the vaccine and placebo arms by Day 164 and its 95% point-wise confidence interval. Histograms of the immunological markers in the vaccine arm are overlaid. lod = 0.3, 1.6, 2.4, 15 for bAb Spike, bAb RBD, PsV nAb ID50, PsV nAb ID80, respectively.
